SAFETY INJECTION DEVICE FOR SYRINGE

5 The device comprises a support sheath (14), a
syringe body (10) secured to said sheath, and a
protection sheath (16) movable between a retracted
position and an extended protection position. The device
includes retaining means (17) for retaining the
10 protection sheath that are adapted to be urged so as to
allow the sheath to be extended. The syringe body (10)
is secured to the support sheath (14) via a ring (20)
including a coupling wall (22) that is substantially
transverse. This wall presents at least one slot (23)
15 enabling the retaining means to be acted upon from the
side of the coupling wall (22) that is opposite from the
distal end of the support sheath.
